

**AMENDMENTS TO THE SPECIFICATION:**

Please replace the abstract with the following amended abstract:

An electrographic printing machine ~~comprising~~including: a first photoconductive member; an imaging device for recording a first latent image on the first photoconductive member to form a ~~second~~first developed image; a first developer unit for developing the first latent image; a second photoconductive member, closely adjacent to the first photoconductive member in a transfer region; a second imaging device for recording a second latent image on the second photoconductive member; a second developer unit for developing the second latent image to form a second developed image; a first transfer station for transferring the second developed image on the second photoconductive member to the first photoconductive member; and a second transfer station for transferring developed images on the first photoconductive member to a recording substrate.

Please replace paragraph number [0001] with the following amended paragraph:

Reference is made to commonly-assigned copending U.S. Patent Application Serial No. ~~(Attorney Docket No. D/A3495)~~ 10/696,212, filed herewith, entitled "Photoreceptor for Highlight Color Printing Machine," by Kiri Amarakoon, the disclosure of which is incorporated herein.

Please replace paragraph number [0006] with the following amended paragraph:

There is provided an electrographic printing machine comprising: a first photoconductive member; an imaging device for recording a first latent image on said first photoconductive member to form a ~~second~~first developed image; a first developer unit for developing said first latent image; a second photoconductive member, closely adjacent to said first photoconductive member in a transfer region; a second imaging device for recording a second latent image on said second photoconductive member; a second developer unit for developing said second latent image to form a second developed image; a first transfer station for transferring said second developed image on said second photoconductive member to said first photoconductive member; and a second transfer station for transferring developed images on said first photoconductive member to a recording substrate.

Please replace paragraph number [0017] with the following amended paragraph:

Conditioning station 220 enables a conventional photoconductive belt 10 to be used as an intermediate transfer belt so that a second toned color image can be transferred to produce a black and a HLC toned image on the belt that can be transferred to media. Alternatively, the use of a belt with a segmented ground plane with disclosed in US Patent Application Serial No. 10/696,214~~patent application D/A2518~~ hereby incorporated by reference. That photoreceptor allows for field tailoring in a desired area (i.e. in an image frame) with use of a biasing pad 400 which addresses the segment ground plane with out effecting the fields on the remaining portion of the photoreceptor belt. Preferably, a conventional photoreceptor can be employed in which field tailoring can be accomplished by employing a discharge lamp on the back of the belt and biasing the drum module with an

ungrounded drum marker module. Both these schemes will require some electrostatic tailoring at the transfer point as shown in Figure 2.
